Swage Packers

IPI's Slimline Swaged Casing Packer System was developed to provide a fast, effective well re-lining system that minimizes losses in bore diameter.

An IPI Swage Packer consists of a thin-wall stainless steel tube clad with a vulcanized rubber cover.

The packer is set by permanently deforming it radially outwards with a high pressure packer that is run and inflated inside the Swage Packer.

These packers can also be used as casing patches to repair isolated holes, etc at any level in a cased hole.

IPI has recently carried out swaging operations on mature Japanese gas wells. Swaging packers may be available for rental operations.
